

BM Tech Services Company Profile

BM Tech Services helps businesses turn ideas and operational challenges into practical technology solutions. We bring together software development, AI and machine learning, connected devices, automation and digital growth services to support better operations and stronger customer engagement.

Technology built around your business

We develop custom solutions and business products across web, mobile and desktop applications, cloud platforms, IoT gateways and embedded systems. Our work spans requirement discovery, architecture, design, development, integration, testing, deployment and ongoing enhancement.

The value we bring

A connected approach. We can bring devices, applications, data and customer workflows into one solution, reducing the effort needed to coordinate separate systems.

A practical starting point. We identify the processes and features that matter first, so your initial investment addresses a clear business need and supports future growth.

Support beyond launch. Maintenance, integration and enhancement services help your technology keep pace with changing operations, users and business priorities.

Software and digital growth services

We build the applications and digital channels businesses use to run operations, serve customers and create new revenue opportunities. Each engagement starts with the intended users, workflow and business outcome.

Custom software and business applications

Web applications and software as a service (SaaS) for business workflows, portals, dashboards, booking, billing, inventory and reporting. We design the user experience, application logic, APIs and data structure around your processes, with roles and permissions suited to the people using the system.

Mobile and desktop applications

Mobile applications for customers, employees, field teams and connected devices, alongside desktop software for office, engineering and industrial use. Capabilities include local workflows, equipment configuration, diagnostics, data capture and reporting, with offline operation and synchronization where the use case requires them.

Website development and hosting

Business websites, product websites, landing pages and online stores designed to explain your offer and make enquiries easier. Services include responsive design, content structure, hosting, deployment and maintenance, with enquiry forms, WhatsApp, booking or CRM integrations as required.

CRM and business automation

Customer relationship management (CRM) setup, customization and integration to organize leads, customer records and follow-ups. We automate sales, approval, onboarding, billing and service workflows so teams can track ownership, reduce repetitive work and see what needs attention.

Digital marketing and business growth

Digital marketing support connects your website, search visibility, content, social channels and campaigns with lead capture and customer follow-up. CRM, marketing automation and analytics help you understand enquiry sources and manage the journey from first interest to repeat business.

Intelligent and connected systems

For products and operations that extend beyond a screen, we combine application engineering with device software, connectivity and data. We select technology according to the operating environment, business priorities and available information.

AI and machine learning

AI assistants, chatbots, document processing, forecasting, anomaly detection and data-driven reporting. We identify a practical use case, assess the available data and integrate AI into the relevant workflow. Validation and human review are planned according to the decisions the solution supports.

IoT gateways and connected devices

Gateway software, sensor and equipment integration, edge processing, cloud connectivity, remote monitoring and alerts. We connect device data with dashboards and business applications so teams can understand equipment conditions and respond to operational events.

Embedded systems and firmware

Firmware, microcontroller and embedded Linux development, drivers, device interfaces and hardware-software integration. Services include communication protocols, diagnostics, update mechanisms and integration with gateways, cloud services and user applications.

Cloud platforms and system integration

Application hosting, databases, APIs, authentication, deployment pipelines and operational monitoring. We connect existing software, websites, CRM, payment services and devices so information can move across the business. Hosting and architecture are chosen around workload, cost and maintenance needs.

Digitalization and technology consulting

Process analysis, technology selection, solution architecture and modernization planning. We help you replace manual records, connect fragmented systems and prioritize improvements. The roadmap can begin with an essential workflow and expand as adoption and business needs grow.

Product portfolio

Our product portfolio focuses on common operating needs in healthcare, hospitality, customer service, digital communication and education. The areas below provide a starting point for product discussions and tailored implementations.

Solution area	Customer fit	Business focus
Clinic Automation	Clinics and healthcare practices	Patient registration, appointments, consultation records, prescriptions, billing and operational reports.
Restaurant Solution	Restaurants, cafés and hospitality operators	Ordering, point of sale, kitchen coordination, menu management, billing, inventory and business reporting.
Website Development & Hosting	Businesses building or improving their digital presence	Company and product websites, enquiry generation, hosting, maintenance and customer engagement integrations.
Smart LED	Retail, hospitality and business display users	Digital display and signage solutions, content presentation, device connectivity and control workflows.
Queue Management	Service counters, clinics, offices and customer-facing facilities	Token and queue workflows, counter allocation, customer displays and visibility into service activity.
Domain Training & Education	Students, institutions and technical teams	Practical learning in software, embedded systems, IoT, AI and automation, including applied projects and capability development.

Choosing the right solution

We assess your workflow, users, locations, devices and integration needs before recommending a product-led approach, customization or a dedicated build. Product demonstrations, feature scope, deployment options and availability are confirmed during the consultation.

Delivery from discovery to support

We can take responsibility for a complete solution or contribute to a defined part of your programme. The engagement is shaped around clear requirements, review points and acceptance criteria.

Understand the requirement

Clarify the business problem, user roles, current workflow, constraints and expected outcome. Identify the essential scope, dependencies and success measures before development begins.

Design the solution

Translate requirements into architecture, user journeys, interface designs and a delivery plan. Use prototypes or a minimum viable product (MVP) when an idea or workflow needs early validation.

Build and integrate

Develop the application, firmware or connected platform and integrate the required systems. Review working increments so feedback can inform implementation while the scope remains visible.

Test and deploy

Plan functional, integration and user acceptance checks around agreed requirements. Assess security, access control and performance needs for the solution, then prepare deployment, documentation and handover.

Maintain and enhance

Provide maintenance, troubleshooting, updates and feature improvements under an agreed support scope. Monitoring, backup and recovery arrangements are planned according to the deployment and business needs.

Flexible ways to work with us

Engage us for a new product or MVP, a defined application build, modernization of existing software, device and cloud integration, or ongoing maintenance. We also support discovery and architecture assignments when you need a clear technical direction before committing to implementation.

Who we work with

BM Tech Services is suited to customers who need a practical technology partner across business applications, connected products and digital growth. We adapt the solution to your processes, operating environment and investment priorities.

Customer type	Where we can help
Startups and product founders	Validate an idea, build an MVP and establish the application or connected-product architecture.
Small and medium businesses	Improve digital presence, introduce CRM and automate everyday operations.
Growing enterprises and service businesses	Modernize applications, connect systems and improve customer and management visibility.
Manufacturers and engineering businesses	Develop firmware, gateways, monitoring applications and device-to-cloud workflows.
Clinics and hospitality operators	Discuss domain solutions for service delivery, ordering, billing and operational reporting.
Institutions and technical teams	Build practical domain knowledge through training and applied technology projects.

Discuss your requirement

Whether you are launching a product, improving a business process or looking for more effective customer engagement, start with the outcome you want to achieve. We can help translate that need into a suitable scope and delivery approach.

Share your current challenge, target users, existing systems, preferred timeline and investment range. For connected solutions, include the devices, interfaces and operating conditions involved. These details help us focus the discussion and prepare a relevant recommendation.

Request a consultation, product walkthrough or tailored proposal. Speak with BM Tech Services about the next step for your business.
